2. Executive Overview

CortexForge Diagnostics is an emerging diagnostic intelligence platform designed to assist automotive technicians in troubleshooting vehicle faults through AI-assisted technical guidance.

Modern vehicles contain increasingly complex electronic architectures consisting of multiple Electronic Control Units (ECUs), sensors, and interconnected electrical systems. While diagnostic tools can retrieve Diagnostic Trouble Codes (DTCs), technicians often require additional support to interpret diagnostic procedures and perform troubleshooting steps correctly.

The CortexForge Diagnostics platform aims to transform traditional static technical documentation into interactive diagnostic intelligence systems that support technician workflows.

The current version of the platform introduces the **Technician Copilot**, an AI-powered interface that assists technicians in retrieving diagnostic information and procedural guidance during troubleshooting.

3. Current Platform Capability

3.1 Technician Copilot (Implemented)

The **Technician Copilot** is the first operational component of the **CortexForge Diagnostics** platform.

It provides a conversational interface that allows technicians to retrieve diagnostic guidance and technical explanations related to vehicle fault diagnosis.

The copilot assists technicians by providing information such as:

- Interpretation of Diagnostic Trouble Codes
- Explanation of diagnostic procedures
- Guidance for performing component checks
- Electrical testing explanations
- Sensor and wiring validation information

The goal of the Technician Copilot is to support technicians during troubleshooting by enabling rapid access to relevant diagnostic knowledge.

This capability reduces the need to manually search through extensive technical documentation during service operations.

4. Platform Architecture (Current System)

The current system architecture focuses on enabling AI-assisted diagnostic information retrieval.

Primary components include:

4.1 Technician Copilot Interface

A conversational interface that allows technicians to ask diagnostic questions and receive contextual responses.

4.2 Knowledge Retrieval Layer

Retrieves relevant diagnostic information from structured technical knowledge sources.

4.3 Diagnostic Knowledge Repository

A repository of technical information related to diagnostic procedures, component validation, and electrical testing.

Together, these components allow technicians to access diagnostic guidance in a more interactive and efficient manner.

5. Intended Technician Workflow

The **CortexForge Diagnostics platform** is designed to support technicians during the vehicle troubleshooting process.

Typical workflow using the current system:

1. A technician retrieves a **Diagnostic Trouble Code** using a vehicle diagnostic tool.
2. The technician consults the **CortexForge Technician Copilot** for guidance related to the fault code.
3. The copilot provides explanations of possible causes, diagnostic checks, and recommended troubleshooting procedures.
4. The technician performs the necessary validation steps during service operations.

The copilot acts as a technical reference assistant during the diagnostic process.

6. Platform Roadmap (Future Capabilities)

The CortexForge Diagnostics platform is currently in its early stage. Future development will expand the system to include additional diagnostic intelligence modules.

Planned capabilities include:

6.1 DTC Diagnostic Workflow Engine

Automatic conversion of Diagnostic Trouble Codes into structured troubleshooting workflows.

6.2 Guided Diagnostic Procedures

Step-by-step instructions guiding technicians through diagnostic processes.

6.3 Electrical Diagnostics Assistant

Procedural guidance for electrical validation including multimeter testing, voltage checks, and wiring verification.

6.4 Visual Diagnostic Support

Integration of visual resources such as technical videos and diagnostic demonstrations within the diagnostic workflow.

6.5 Diagnostic Procedure Navigator

A structured interface that allows technicians to follow troubleshooting procedures in a step-by-step format.

6.6 Diagnostic Session Tracking

Tracking and recording of technician diagnostic workflows for training and analysis purposes.

These capabilities are part of the long-term product roadmap and will be introduced in future platform versions.

7. Vision

The long-term vision of CortexForge Diagnostics is to create an intelligent diagnostic platform that transforms traditional service documentation into interactive troubleshooting systems.

The platform aims to augment technician expertise by providing structured diagnostic guidance and contextual knowledge retrieval during vehicle service operations.

By integrating AI technologies with structured diagnostic knowledge, CortexForge Diagnostics seeks to improve the efficiency and accuracy of automotive service diagnostics.

8. Mission

The mission of CortexForge Diagnostics is to support technicians in diagnosing increasingly complex vehicle systems by providing accessible, intelligent technical guidance.

The platform aims to:

- Reduce the time required to identify vehicle faults
- Improve technician decision-making during troubleshooting
- Simplify access to technical diagnostic knowledge
- Support training and knowledge transfer within service organizations

9. Future Platform Direction

As the platform evolves, CortexForge Diagnostics will expand its capabilities to support a broader range of diagnostic intelligence applications including:

- Model-specific diagnostic knowledge systems
- Advanced electrical diagnostics support
- Interactive technician training modules
- Integration with diagnostic hardware tools
- Data-driven diagnostic insights

These developments will gradually transform the platform into a comprehensive automotive diagnostic intelligence ecosystem.

10. About aXtrLabs

CortexForge Diagnostics is developed by **aXtrLabs**, a technology company focused on building domain-specific artificial intelligence systems for complex technical workflows.

The company develops AI platforms that integrate structured knowledge, machine learning technologies, and intuitive user interfaces to support professionals across technical industries.
